AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing Of Claims:

- (Currently Amended): A distributor plate releasably mounted on a horizontal lower disc of a rotor for a vertical shaft impact crusher, said rotor having an opening for the intake of material to be crushed and at least one outflow opening for material leaving the rotor, wherein a shape of the distributor plate is an equilateral polygon as seen from above, wherein the distributor plate has a lower surface and an upper surface, and wherein the upper surface comprises an unbroken layer.
- (Previously Presented): The distributor plate according to claim 1, wherein the shape of the distributor plate is selected from the group consisting of triangular, square, hexagonal, octagonal and nonagonal shapes.
- 3. (Previously Presented): The distributor plate according to claim 1, wherein the number of sides of the polygon being chosen is selected such that the number of sides is 1, 2 or 3 times the number of outflow openings of the rotor to which the distributor plate is mounted.
- (Previously Presented): The distributor plate according to claim 3, wherein the number of sides is 2 times the number of outflow openings of the rotor.

5. (Previously Presented): The distributor plate according to claim 1, wherein at

least one straight side edge of the distributor plate is parallel to an outflow direction of material

leaving the rotor and is parallel and adjacent to a face of a lower wear plate protecting the lower

disc from wear.

6. (Previously Presented): The distributor plate according to claim 1, wherein the

distributor plate at the center of its lower face has a recess to make the distributor plate

horizontally turnable around a vertical shaft mounted on the lower disc, such that the position of

the distributor plate in relation to the lower disc may be adjusted before mounting the distributor

plate.

7. (Previously Presented): The distributor plate according to claim 6, wherein the

recess extends only through a part of the thickness of the distributor plate, the upper face of the

distributor plate thus being unaffected by said recess.

8. (Previously Presented): The distributor plate according to claim 6, wherein the

distributor plate has a lower surface which is located at a higher level than the upper surface of

lower wear plates protecting the lower disc of the rotor, such that the distributor plate may be

adjusted without removing the lower wear plates.

9. (Previously Presented): The distributor plate according to claim 1, wherein the

upper face of the distributor plate comprises an unbroken layer of a hard metal.

ATTORNEY DOCKET NO.: 47113-0004

Application No.: 10/525,978 Page 4

10. (Previously Presented): The distributor plate according to claim 1, wherein the

distributor plate comprises mounting means located at a vertical side edge of the distributor plate

for mounting of a vertical support fixing the distributor plate to the lower disc of the rotor.

11. (Withdrawn - Currently Amended): A rotor for a vertical shaft impact crusher,

the rotor having an opening for the intake of material to be crushed, at least one outflow opening

for material leaving the rotor, and at least one lower wear plate and a distributor plate releasably

mounted on a horizontal lower disc of the rotor, wherein the distributor plate has a shape defined

by an equilateral polygon as seen from above, at least one straight side edge of the distributor

plate being parallel to an outflow direction of material leaving the rotor and being parallel to and

adjacent to a face of the lower wear plate.

12. (Previously Presented): The distributor plate according to claim 9, wherein the

upper face of the distributor plate comprises an unbroken layer of tungsten carbide.

13. (Currently Amended): A distributor plate adapted to be releasably mounted on a

horizontal lower disc of a rotor of a vertical shaft impact crusher, wherein a shape of the distribution plate is an equilateral polygon as seen from above, wherein the distributor plate has a

lower surface and an upper surface, and wherein the upper surface comprises an unbroken layer.

lower surface and an upper surface, and wherein the upper surface comprises an unbroken layer.

 (Previously Presented): The distributor plate according to claim 13, wherein the shape of the distributor plate is selected from the group consisting of triangular, square,

hexagonal, octagonal, nonagonal, and dodecagonal shapes.

(Previously Presented): The distributor plate according to claim 13, further

comprising a recess at the center of its lower face adapted to make the distributor plate

horizontally turnable around a vertical shaft mounted on the lower disc, such that the position of the distributor plate in relation to the lower disc may be adjusted before mounting the distributor plate.

- 16. (Previously Presented): The distributor plate according to claim 15, wherein the recess extends only through a part of the thickness of the distributor plate, and wherein the upper face of the distribution plate is free of the recess.
- 17. (Previously Presented): The distributor plate according to claim 13, wherein the upper face of the distributor plate comprises an unbroken layer of a hard metal.
- 18. (Previously Presented): The distributor plate according to claim 13, wherein the upper face of the distributor plate comprises an unbroken layer of tungsten carbide.
- 19. (Previously Presented): The distributor plate according to claim 13, further comprising mounting means located at a vertical side edge of the distributor plate adapted for the mounting of a vertical support fixing the distributor to the lower disc of the rotor.
- (Previously Presented): The distributor plate according to claim 19, wherein the mounting means comprises a hole with an inner thread adapted to receive a bolt.
